

Silka chamfered blocks

WALLS THAT MAY BE SEEN BUILT WITH EASE AND SPEED

silka

Silka chamfered blocks: suited for all projects

Silka chamfered blocks are suitable for use in load-bearing and non load-bearing wall structures in single and double-sided fair-face masonry. Silka chamfered blocks are available in formats that can be laid manually and mechanically. The blocks are extremely dimensionally stable and therefore ideal for use with thin joint mortars. The specific qualities of calcium silicate, like sound insulation, high load bearing capacity and thermal mass, accompany the blocks' building qualities for free.

Simple and fast processing

Silka chamfered blocks have a tongue and a groove to help process them with ease and speed. Their dimensions are moduled for glued joints. Chamfered blocks can be left 'fairfaced' thanks to their very smooth face, but can also easily be painted to enhance the appearance of the wall.

Suited for conduits and pipes

Silka chamfered blocks are available in either solid or void format. The voided Silka chamfered blocks

have a defined drill-hole pattern so that two holes align vertically. Afterwards, conduits and pipes for water-based heating or cooling systems fit perfectly into those holes. Drill holes, e.g. for electrical boxes, can be formed with

a drill bit at the location of the vertical holes.

Fixation with ease

Walls made of Silka chamfered blocks are suitable not only for hanging picture frames, but for

Silka chamfered blocks can be left 'fairfaced' or may be painted.

securing heavy objects like cupboards, fire hose reels and cable ducts as well. All by simply using standard nylon wall plugs and screws for anchoring.

Everything in one hand

Apart from the project design and throughout construction, Xella gives free project oriented advice and service on site. Should you have questions, you can reach us on 0843 290 9080.
